(a) A structural prefix gap

One template; changing metadata

Request 1

Request 2

Native match ends at the change.

Stable documents repeat after that boundary.

Repeated text ≠ reusable prefix

(b) Compile and qualify

CALC

Dependency-valid layout; exact token identity

Scoped behavioral certification

Witness protocol (evaluated separately)

Deployment: qualified route | Query: first raw reply

Teacher-forced token-path + EOS checks

Evidence bound to layout, scope and execution

Failed / ineligible → raw route

(c) Publish and reuse

Service-Template Certificate

Identity · scope · authorization

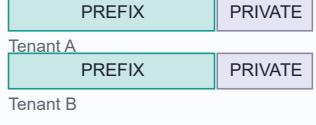
Stable-prefix hash · lifecycle epoch

PSTP: atomic publication

PASS + valid binding → commit

FAIL → no candidate promotion

Same template, authorized tenants



Qualification permits reuse; native cache residency determines the realized hit.
